

## The iron-iron carbide (Fe-Fe<sub>3</sub>C) phase diagram

- Ferrite- $\alpha$  -BCC, low C solubility(0.022%wt), magnetic
- Austenite- $\gamma$ -FCC, high C solubility(2.14%wt), nonmagnetic
- Ferrite- $\delta$ -BCC
- Cementite (Fe<sub>3</sub>C)
- Eutectic, peritectic, eutectoid
- Iron, ferrite (C<0.008wt%)
- Stainless steel,  $\alpha + \text{Fe}_3\text{C}$  (0.008-2.14wt%)

## Microstructures of iron

(a)  
 $\alpha$ - ferrite

(b)  
austenite

## Interstitial sites of FCC

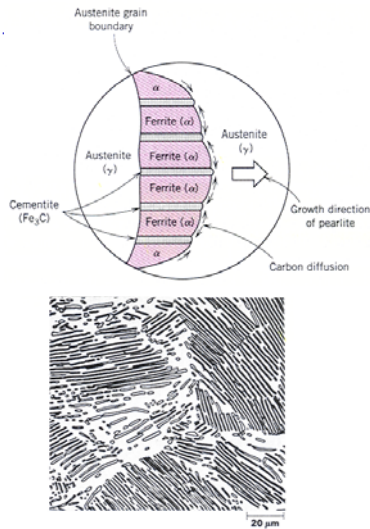

## Interstitial sites of BCC

## Microstructure in iron-carbon alloys

### □ Eutectic-pearlite

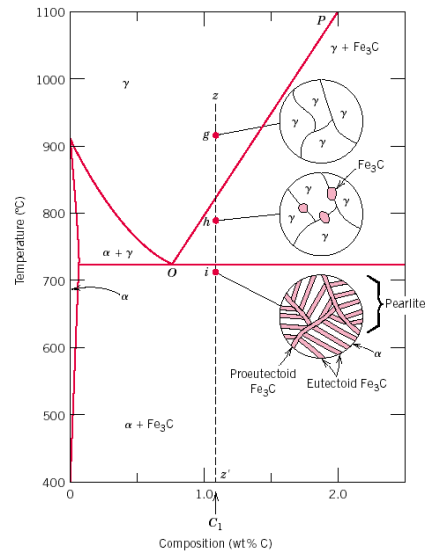

## Hypoeutectoid alloys

### □ Hypoeutectoid steel: has a carbon concentration less than the eutectoid

## Hypereutectoid alloys

- Hypereutectoid steel: has a carbon content greater than the eutectoid

## Example: Phase Equilibria

For a 99.6 wt% Fe-0.40 wt% C at a temperature just below the eutectoid, determine the following

- composition of  $\text{Fe}_3\text{C}$  and ferrite ( $\alpha$ )
- the amount of carbide (cementite) in grams that forms per 100 g of steel
- the amount of pearlite and proeutectoid ferrite ( $\alpha$ )

## Phase Equilibria

Solution: a) composition of  $\text{Fe}_3\text{C}$  and ferrite ( $\alpha$ )

b) the amount of carbide (cementite) in grams that forms per 100 g of steel

$C_0 = 0.40 \text{ wt\% C}$   
 $C_\alpha = 0.022 \text{ wt\% C}$   
 $C_{\text{Fe}_3\text{C}} = 6.70 \text{ wt\% C}$

$$\frac{\text{Fe}_3\text{C}}{\text{Fe}_3\text{C} + \alpha} = \frac{C_0 - C_\alpha}{C_{\text{Fe}_3\text{C}} - C_\alpha} \times 100$$

$$= \frac{0.4 - 0.022}{6.7 - 0.022} \times 100 = 5.7 \text{ g}$$

$\text{Fe}_3\text{C} = 5.7 \text{ g}$   
 $\alpha = 94.3 \text{ g}$

## Phase Equilibria

c. the amount of pearlite and proeutectoid ferrite ( $\alpha$ )  
 note: amount of pearlite = amount of  $\gamma$  just above  $T_E$

$C_0 = 0.40 \text{ wt\% C}$   
 $C_\alpha = 0.022 \text{ wt\% C}$   
 $C_{\text{pearlite}} = C_\gamma = 0.76 \text{ wt\% C}$

$$\frac{\gamma}{\gamma + \alpha} = \frac{C_0 - C_\alpha}{C_\gamma - C_\alpha} \times 100 = 51.2 \text{ g}$$

pearlite = 51.2 g  
 proeutectoid  $\alpha$  = 48.8 g

## The influence of other alloying elements

- $T_{\text{Eutectoid}}$  changes:

- $C_{\text{Eutectoid}}$  changes:

## Review Fe-C phase diagram

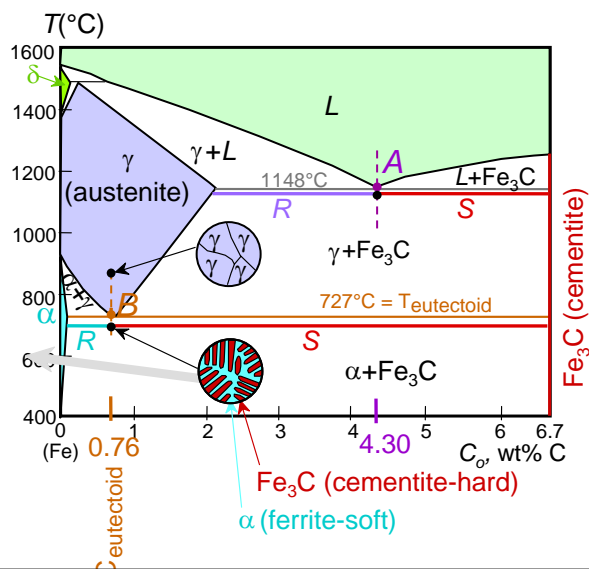

- 2 important points

-Eutectic (A):  
 $L \Rightarrow \gamma + \text{Fe}_3\text{C}$

-Eutectoid (B):  
 $\gamma \Rightarrow \alpha + \text{Fe}_3\text{C}$

Result: Pearlite = alternating layers of  $\alpha$  and  $\text{Fe}_3\text{C}$  phases

## Summary

---

- **Phase diagrams** are useful tools to determine:
  - the number and types of phases,
  - the wt% of each phase,
  - and the **composition** of each phasefor a given  $T$  and composition of the system.
- Alloying to produce a solid solution usually
  - increases the tensile strength ( $TS$ )
  - decreases the ductility.
- Binary **eutectics** and binary **eutectoids** allow for a range of microstructures.
